The Federal Safe Drinking Water Act requires each *community* public water system to develop and distribute a consumer confidence report (CCR) to its customers each year. Depending on the population served by the public water system, this CCR must be mailed to the customers, published in a newspaper of local circulation, or provided to the customers upon request.

Please	Answer the Fo	lowing Questions Regarding the Consumer Confidence Report

# 2009 Annual Drinking Water Quality Report Mt. Comfort Water Association PWS#: 070010, 070011, 070014, 070017, 070020 & 070023 June 2010

2010 JUN -8 PM 12: 47

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water. Our water source is from wells drawing from the Gordo Formation Aquifer.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contamination. The general susceptibility rankings assigned to each well of this system are provided immediately below. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Mt. Comfort Water Association have received lower to moderate susceptibility rankings to contamination.

If you have any questions about this report or concerning your water utility, please contact Benny Stewart at 662-983-8027. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. They are held on the first Tuesday of each month at 7:00 PM at the Mt. Comfort Water Association office located at 209 Center Street, Bruce, MS or the annual meeting held on the first Tuesday of September at 7:00 PM at the same location.

We routinely monitor for constituents in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that were detected during the period of January 1<sup>st</sup> to December 31<sup>st</sup>, 2009. In cases where monitoring wasn't required in 2009, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) — The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) — The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

<sup>\*</sup> Most recent sample. No sample required for 2009.

Microbiological Contaminants

As you can see by the tables, our system had no violations for 2009. However, in January of 2010 we received a MCL violation for the Total Coliform Rule. We took 11 samples for coliform bacteria, three of those samples showed the presence of coliform bacteria. We took the necessary measures to return the system in compliance and are proud to report that all re-samples came back free of coliform bacteria.

We are required to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. In an effort to ensure systems complete all monitoring requirements, MSDH now notifies systems of any missing samples prior to the end of the compliance period.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our Water Association is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing for \$10 per sample. Please contact 601.576.7582 if you wish to have your water tested.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1-800-426-4791.

The Mt. Comfort Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

<sup>(1)</sup> Total Coliforms. Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially-harmful, bacteria may be present. Coliforms were found in more samples than allowed and this was a warning of potential problems.

A report consistent detailed interesting to the system are provided immediately below. A report consistent detailed information on their this susceptibility identification states that the state of the system are in available for viewing upon request. The wells for the St. Comfort Water Association have received lover to moderate succeptibility reachings to

If you have any questions about this report or concerning your voice reliefy, please contact Sermy Stewart at 650-650-0027. We say our valued of the property of the property

We noticely minister for constituents in your droking water according to Federal and State leave. This table below this oil of the drinking water according to the continuements has were detected drinking the period of quality of the December 31\*, 2008. In cases without membricing water inspection 2006, the table reflects the most record results. As weller throttly over the surface of land or underground, it disables not below the product of the surface and productive metabolish and case lively as electance or contributions, and the presence of ambients or contributions, carbon, increase a structure and the surface or contributions, and the presence of ambients or contributions, and categories, that may come from severage involutions/places, applicatives livestock, operations, and widelity, increase of contributions, and carbon services in the surface of contributions, and carbon services in the surface of contributions, such as a set of contributions, and carbon services are contributions and mining activities. As order to ensure that the services the contributions are contributed to the contribution of the contributions are contributed to product states of services are contributed to the contributions and mining activities. As order to ensure that the sweet is select to the Proprocedure confidence and the contributions are contributed to the contributions and mining activities.

in this table you will find many terms and abbreviators you might not be familiar with. To help you better understand those terms we've provided the between definitions:

Action Level - the concentration of a contaminant which, it exceeded, triggers breakment or other requirements which a water system must follow.

Machinum Contemberal Level (MCL) - The "Meconium Allowed" (MCL) is the highest level of a contembrant that is showed in disking water. MCLs are set as sless to the MCL as as fusable using the best available transment instructions.

Minimum Contentrated Level (Goal (MCLG) - The "Cost"(MCLG) is the level of a contemberal in distribute water testor which there is no known or expected rick to health. MCLGs elsewhore manages of select.

Machinem Francium Descriptions (Armil (MFDC) — The highest level of a distributional allowed in shinking water. There is convincing evidence that addition of a distribution is necessary for control morphisis contembrants.

health. MEDILCs do not reflect the benefits of the use of distributions to control microbial contemporaries.

The second control of the second control to the second control of the second control of

As you can see by the tables, our system lest as violations for 2009, However, in January of 2010 we received a MCL violation for the Total Conform Rule. We took \$1 samples for collision bacteria, three of finder seripties allowed the presence of collisions bacteria. We took the receivery measures to return the cycleton in completions and are proud to import being at re-earquies came back these of collisions backeria.

We are troppined to monitor your distrating profes for expected consistances on a monthly basis. Remarks of regular monitoring are on indicating of whether or not our distrating erects meets health abundants. In an advant to ensure appears complete all monitoring requirements, MSDM now notified by abundance of any monitoring accupate prior to the end of the compliance partied.

(increme), corruptes prior to the erral of the Composition person.

If present, described locals of least can come service health problems, especially for prograded women and young chiefmen. Load is drinking water is primarily from metales and composition associated with service lines and forms plantidge. Our Water Associated her provide programs of the provided programs of the programs of the provided programs. If the program is the program is the provided programs of the provided programs of the provided programs of the provided programs of the progr
